## Color Spaces (Coordinate Systems)

- RGB
- CMY/CMYK
- YIQ
- YUV
- YCbCr
- HSL/HSV
- ...

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in Images - RGB

- RGB color model for CRT displays
  - stores color information in directly in RGB form
  - device-dependent
  - additive color model

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in Images - RGB

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in Images - CMY

- *CMY* for printing
  - primary colors : Cyan, Magenta, Yellow
  - subtractive model
  - $C = 1 - R$
  - $M = 1 - G$
  - $Y = 1 - B$

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in Images - CMYK

- Using truly black ink for black is cheaper than mixing C, M, and Y to produce black.
- *CMYK*: like *CMY*, uses black (K) as fourth color.
  - Given  $(C, M, Y)$ ,
  - $K = \min(C, M, Y)$
  - $C = C - K$
  - $M = M - K$
  - $Y = Y - K$

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in TV/Video - YUV

- YUV color model was used for PAL and SECAM video.
- PAL, short for Phase Alternating Line, is a color video signal format used in broadcast television systems in Europe.

$$\begin{bmatrix} Y' \\ U \\ V \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.144 \\ -0.299 & -0.587 & 0.886 \\ 0.701 & -0.587 & -0.114 \end{bmatrix} \begin{bmatrix} R' \\ G' \\ B' \end{bmatrix}$$

$Y'$  is called "luma".

$U = B' - Y'$  is "chrominance "

$V = R' - Y'$  is also "chrominance"

$R', G', B'$  : gamma corrected R, G, B

- Color TV signal can be displayed on a black-and-white television by using  $Y'$  signal.

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in TV/Video - YUV

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in TV/Video - YIQ

- YIQ color model is used in NTSC (short for the National Television Standards Committee) color TV broadcasting in North America and Japan.

$$\begin{bmatrix} Y' \\ I \\ Q \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.144 \\ 0.595879 & -0.274133 & -0.321746 \\ 0.211205 & -0.523083 & -0.311878 \end{bmatrix} \begin{bmatrix} R' \\ G' \\ B' \end{bmatrix}$$

*Y' is called "luma".*

*I is for "in - phase chrominance"*

*Q is for "quadrature chrominance"*

$R', G', B'$  : gamma corrected R, G, B

- UV of YUV are more simply defined. But they do not capture the most-to-least hierarchy of human perceptual color sensitivities compared to IQ of YIQ.

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in TV/Video - YIQ

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Color Models in TV/Video - YCbCr

- YCbCr is the international standard for component(three-signal) digital video recommended by ITU (International Telecommunication Union). Used for JPEG and MPEG standards.

$$\begin{bmatrix} Y' \\ Cb \\ Cr \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.144 \\ -0.168736 & -0.331264 & 0.5 \\ 0.5 & -0.418588 & -0.081312 \end{bmatrix} \begin{bmatrix} R' \\ G' \\ B' \end{bmatrix} + \begin{bmatrix} 0 \\ 0.5 \\ 0.5 \end{bmatrix}$$

*Y' is called "luma".*

*Cb is blue chrominance*

*Cr is red chrominance*

R', G', B' : gamma corrected R, G, B

- YCrCb is closely related to YUV. However, YUV is an analog system with scale factors different than the digital YCbCr system

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Why RGB is not used for Video?

- Human visual system is more sensitive to luminance than chrominance.
- YUV, YIQ and YCrCb represent color with *luminance* (Y) and *chrominance*(the other 2 channels).
- Advantages:
  - We can subsample the chrominance channels(e.g., 4:2:2, 4:2:0 subsampling schemes)
  - We can quantize the chrominance channels more coarsely (with fewer bits)

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Chrominance Subsampling Schemes

- Human visual system is less sensitive to the *Chrominance* channels than to *Luminance* channel
- We can *subsample* the chrominance channels without noticeable loss of detail
- Color subsampling schemes:
  - 4:1:1: 1 sample of each chrominance channel every 4 samples of luminance
  - 4:2:0: 1 sample of each chrominance channel every 4 samples of luminance
  - 4:2:2: 1 sample of each chrominance channel every 2 samples of luminance

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Chrominance Subsampling Schemes

- 4:4:4 : Cb/Cr Same as Luma

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

# Chrominance Subsampling Schemes

- 4:2:2 (1/2 the Luma Samples)

From Computer Desktop Encyclopedia  
© 2004 The Computer Language Co., Inc.

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

# Chrominance Subsampling Schemes

- 4:1:1 (1/4 the Luma Samples)

From Computer Desktop Encyclopedia  
© 2004 The Computer Language Co., Inc.

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

# Chrominance Subsampling Schemes

From Computer Desktop Encyclopedia  
© 2004 The Computer Language Co., Inc.

- 4:2:0 (1/4 the Luma Samples, The zero in 4:2:0 means that Cb and Cr are sampled at half the vertical resolution of Y. )

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Sample Questions

- What are the advantages of using a different color space than RGB (e.g., YCrCb) for the sampling and compression of color images and video?
- Consider a video format with 325 lines/frame, 490 pixels/line, 30 frames/s, color subsampling scheme 4:2:2, image aspect ratio: 4:3. Compute the bit-rate of the system (assuming each luminance and chrominance sample is quantized with 8 bits).

Ans: 76.44 Mbits

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

# Gamma Correction

- The RGB number in an image file are converted back to analog and drive the electron guns. For each gun, the power of the emitted light is a function of the *control voltage*. Ideally, the emitted light is would be linearly proportional to the voltage. In practice, the relation is *not linear* and the emitted light is roughly linearly proportional to the voltage raised to the  $\gamma$  (gamma) power.
- So if the file value in the red channel is  $R$ , the screen emits light proportionally to  $R^\gamma$  (unwanted distortion). We need to correct the output by raising to the power  $(1/\gamma)$  so that the given input  $R$  will be displayed as it is by going through  $(R^{1/\gamma})^\gamma \rightarrow R$ . This transformation is called *gamma correction*.
- TV systems pre-correct for this situation by applying inverse transformation before transmitting TV signals. So it transmits  $R^{1/\gamma}$ .

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

# Gamma Correction

Effect of gamma correction: (a) no gamma correction — effect of CRT on light emitted from screen (voltage is normalized to range 0 .. 1); (b) gamma correction of signal.

CSULA CS4551 Multimedia Software Systems by Eun-Young Kang

## Gamma Correction

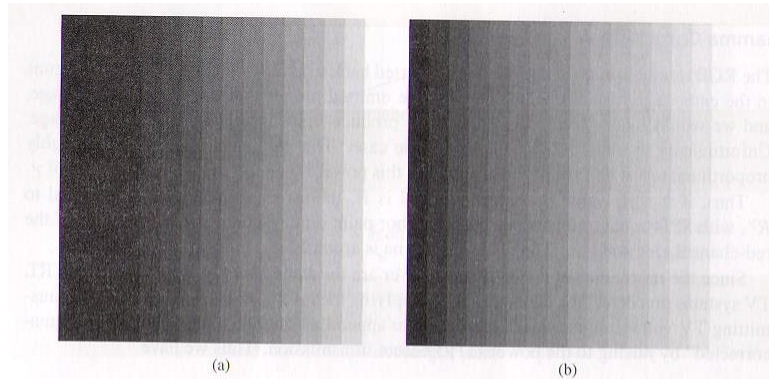

FIGURE 4.7: Effect of gamma correction: (a) display of ramp from 0 to 255, with no gamma correction; (b) image with gamma correction applied.
